

HACHEMI Abdelaziz

Backend Engineer | APIs, Microservices & Distributed Systems

Sidi Bel Abbes, Algeria | +213 798 460 864 | hachemi0abdelaziz@gmail.com

[LinkedIn](#) | [GitHub](#) | devlearnops.me | Open to Remote & Relocation

SUMMARY

Backend engineer with three years of production work, from freelance client delivery since 2023 through a live multi-service product. I design REST and event-driven services in TypeScript (NestJS) and Java (Spring Boot), persist them in PostgreSQL, and run them on Kubernetes with CI/CD, observability, and incident debugging. Seeking a remote backend engineering role.

CORE PROFICIENCIES

Languages & APIs: TypeScript, JavaScript, Java, NestJS, Node.js, Express, Spring Boot, REST, gRPC, microservices, WebSockets, JWT, OAuth 2.0

Data & messaging: PostgreSQL, Redis, MongoDB, Kafka, database-per-service, idempotent webhooks, query design

Runtime & delivery: Docker, Kubernetes (k3s, k3d), Terraform, Ansible, GitHub Actions, GHCR, Kong, Nginx, Caddy, Prometheus, Linux

PROFESSIONAL EXPERIENCE

Founding Engineer

2025 – Present

DevLearnOps | Remote | devlearnops.me

- Shipped 86 catalog labs to devlearnops.me: a student starts a lab, works in a real container, and gets an automatic pass or fail
- Isolated every lab in its own Kubernetes namespace and capped the host at 15 concurrent labs (3 per student), so one session cannot see another student's work or exhaust the machine
- Wired Lemon Squeezy and Chargily so a confirmed payment sets the account to PRO and opens gated labs, with no manual unlock
- Moved production from a local cluster to Kong and GHCR: a push builds the services, rolls them on k3s, and the public health check stays green
- Cached lab images on the node so a warm pod reached Ready in about 2 seconds, cached token and billing lookups for 60 seconds, and cut the Kafka consumer timeout from 120 seconds to 30 so a dead worker rejoins without a two-minute stall

Freelance Software Engineer

2023 – Present

Remote (Algeria) | local businesses and independent clients

- Took client ideas from a first conversation to a site they could actually use, including the account, data, and admin flows behind the page
- Stayed on after launch: fixes, updates, and backups, so the client was not left with a demo that died the week it went live

Full-Stack Web Developer

Sep 2024 – Oct 2024

Algérie Télécom | Sidi Bel Abbes, Algeria

- Shipped customer-facing screens and the internal services behind them for the company's information systems
- Documented and watched production releases, so a change could be traced after it went out

SELECTED PROJECTS

Zero-Downtime Deployment Pipeline

2026

[GitHub](#)

- Cut a full release, from checks to a live update, to under 5 minutes
- Shipped updates without taking the service offline, and rolled a bad release back automatically when the post-deploy check failed

Availability Monitor

2026

[GitHub](#)

- Reached 350+ users in Algeria by alerting them in the browser and on Telegram the moment livestock slots opened, instead of making them refresh a government page

Patient Management System

2026 – Present

[GitHub](#)

- Built patient records, billing, and reporting as separate Spring Boot services, so a billing change does not take the patient API down
- On each new patient, opened billing and published the change on Kafka, so reporting updates without waiting on the create request
- Put a gateway and login in front of the APIs, then ran the same system on AWS, so clients use one door and the

stack is not stuck on one machine

EDUCATION

Master of Computer Science (MSCS) — Information Systems & Web Development
École Supérieure en Informatique (ESI-SBA), Sidi Bel Abbes, Algeria
